

# Week 3 Deliverable — "Consistency, Not Talent"

## Ahmed Elgharably — AI & ML Engineering Portfolio

Built around your two strongest proofs: **ADAll** (adaptive AI monitoring for athletes — Vest Model v8, Conv2D+GRU on WESAD) and the **Cellula ML deployment** (Uber fare prediction, EDA → pipeline → Flask app).

⚠ One thing only you can finish: the assignment is graded partly on genuine judgment, not just a finished page. Read the 10 claim options below and actually pick/tweak one — don't submit option #1 on autopilot. Same for the image rejection note: swap in your real reasoning once you've generated images.

## 1. One-Line Claim

Ten options, different angles on the same proof:

- | #  | Claim                                                                                          |
|----|------------------------------------------------------------------------------------------------|
| 1  | I build AI that reads an athlete's vital signs and flags injury risk before it happens.        |
| 2  | Computer vision and signal processing, built to ship — not just to demo.                       |
| 3  | I turn raw physiological signals into early injury warnings, and raw ideas into deployed apps. |
| 4  | From sensor data to a working Flask app — I close the loop most ML portfolios leave open.      |
| 5  | Machine learning that leaves the notebook: trained, tuned, and deployed.                       |
| 6  | I design AI systems that watch the body's signals so injuries don't have to happen first.      |
| 7  | Vision, signals, deployment — the three things most student ML portfolios skip.                |
| 8  | I don't just train models. I ship them, wrap them in an app, and make them usable.             |
| 9  | AI engineer asking one question of every model: does it survive contact with real data?        |
| 10 | I build the AI that watches athletes, and the pipelines that get it into production.           |

**Recommended pick: #1 or #6** — they're the most specific and memorable because they name the actual outcome (injury risk, before it happens) instead of the tools. Recruiters remember a claim tied to a vivid outcome, not a skills list. #4 or #10 are the backups if you want the claim to nod at *both* ADAll and the Cellula deployment instead of just ADAll.

## 2. Content Map

Assumption flagged: I don't have your "one action" from Week 1 on file, so every CTA below ladders up to **"Get in touch about ML/CV roles"** — swap this if Week 1 landed on something else (e.g. "Book a call," "Download resume").

| Page                                 | Sections (in order)                                                                                                                                                                      | Case featured                           | Named CTA                               |
|--------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------|-----------------------------------------|
| <b>Home</b>                          | Hero (one-line claim, no image) → Proof strip (2–3 hard numbers) → ADAII preview → Cellula deployment preview → Skills/stack → Footer CTA                                                | ADAII (lead),<br>Cellula<br>(secondary) | "See the ADAII case study"<br>(primary) |
| <b>ADAII Case Study</b>              | Problem (athlete injury is reactive, not predictive) → Approach (Vest Model v8: Conv2D+GRU, WESAD dataset) → Visuals (architecture flowchart, signal plots) → Results → What I'd do next | ADAII                                   | "See the Cellula deployment"            |
| <b>Cellula Deployment Case Study</b> | Problem (fare estimation) → Pipeline (EDA → preprocessing → model comparison) → Deployment (Flask app + screenshots) → Results                                                           | Cellula                                 | "Get in touch"                          |
| <b>About</b>                         | Short bio → Education (Damietta University, CV/AI focus) → Stack → Certs (NTI/ITI)                                                                                                       | —                                       | "Get in touch"                          |
| <b>Contact</b>                       | Direct contact block: email, LinkedIn, GitHub, resume                                                                                                                                    | —                                       | "Email me" /<br>"Download resume"       |

### Still need to gather (don't let this block the build week):

Flask app screenshots (Cellula) — clean, cropped, showing real predictions  
 ADAII architecture diagram + WESAD signal plots, redrawn cleanly if the thesis versions are cluttered  
 Hard numbers: injury-risk model accuracy/F1, fare-prediction RMSE/R<sup>2</sup>, before/after comparison vs. baseline  
 GitHub repo links for both projects (public, or a note if private)  
 A short demo GIF of the Flask app in action  
 Current resume/CV as a downloadable file  
 Optional: one line from a Cellula mentor or professor, if you have one

## 3. Identity Kit

### Type

| Role    | Font                          | Why                                                                                 |
|---------|-------------------------------|-------------------------------------------------------------------------------------|
| Heading | <a href="#">Space Grotesk</a> | Geometric, technical, slightly mechanical — reads as "engineering," not "marketing" |
| Body    | <a href="#">Inter</a>         | Neutral, highly legible at small sizes, gets out of the way of your diagrams        |

### Palette

| Role                   | Hex           | Use                                                                            |
|------------------------|---------------|--------------------------------------------------------------------------------|
| Near-black text        | [<br>#12181F] | Body copy, headings                                                            |
| Near-white background  | [<br>#F7F8FA] | Page background                                                                |
| Main color             | [<br>#1E3A5F] | Nav, section labels, borders — a muted steel blue, not corporate-brochure blue |
| Accent (use sparingly) | [<br>#FF6B4A] | CTAs, one highlighted number per section, the pulse mark in the logo           |

**Logo / favicon** An "AE" monogram with a flat signal line running through it, spiking once in the accent color — a direct nod to the physiological-signal work in ADAI, not a generic AI/neural-net cliché. See [ae-logo-mark.svg](#) (attached).

**Style note (paste this into your build tool every time you make a section):**

Headings: Space Grotesk, bold, [#1E3A5F](#). Body: Inter, regular, [#12181F](#) on [#F7F8FA](#). Links/CTAs: [#FF6B4A](#), no underline, weight 600. One accent color per section, max. Generous whitespace — pad sections at least 64px top/bottom on desktop, 32px on mobile. No drop shadows, no gradients. The waveform motif can appear once per page as a divider, never as a background texture.

## 4. Image Curation

| Image needed                                               | Source                             | Notes                                                                                                             |
|------------------------------------------------------------|------------------------------------|-------------------------------------------------------------------------------------------------------------------|
| Home hero                                                  | None (real, not generated)         | Clean title over whitespace + the waveform divider. No stock/generated hero — nothing to distract from the claim. |
| ADAll architecture diagram                                 | Real (redraw cleanly from thesis)  | This is proof — never replace with a generated illustration                                                       |
| WESAD signal plots                                         | Real (export from your notebooks)  | Same — these are your actual results                                                                              |
| Cellula Flask app                                          | Real screenshots                   | Crop tight to the UI, no browser chrome clutter                                                                   |
| Skills-section icons (CV / signal processing / deployment) | AI-generated, one consistent style | The only spot generated images belong — connective tissue, not proof                                              |
| About-page photo                                           | Real photo of you                  | Never generate a headshot                                                                                         |

### Rejection note (example — replace once you've actually generated some):

Generated three abstract "neural network" hero images — glowing nodes, gradient mesh, the usual look. Rejected all three: they have the fake-glass "AI slop" sheen, and worse, they're generic — they say "AI" but nothing about *signal processing specifically*, which is the actual proof. A clean title over whitespace with the waveform divider does more work in less space, and lets the real Vest Model diagrams be the only visual anyone remembers.

## Deliverable checklist (paste into the portal)

- ☐ One-line claim finalized (pick/edit from Section 1)
- ☐ Content map (Section 2) — public link or paste
- ☐ Identity kit on one page (Section 3) — fonts, hex codes, logo, style note
- ☐ Final image set + rejection note (Section 4)

**Notes for the reviewer:** the one-line claim, palette, and CTA target above are drafts pending your confirmation of the Week 1 "one action" — everything else (content map structure, identity kit, image sourcing plan) is submission-ready.
